➤ Application

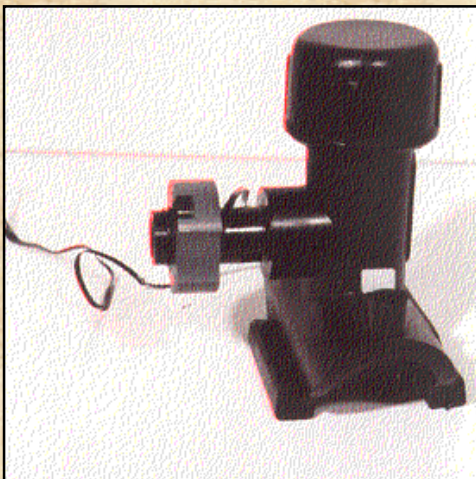

This tool is used to scrape the pipe surface before electrofusion of the tapping tee to the service pipe.

As it is very inexpensive, it can be supplied with each tapping tee and discarded after use.

➤ Performance

It comprises a simple plastic ring fitted with a metal blade. It scrapes off the desired surface thickness and waste matter is removed via a recess in the ring.

Thanks to its original split design, the ring is elastic and capable of adapting to defects in pipe roundness.

- ✓ Currently designed for use with a diameter of 0.8 inches
- ✓ Saves time and associated costs
- ✓ Simple to use
- ✓ Optimizes the sleeve fusion process
